

PROFILE

Backend-oriented engineer who turns unclear requirements, fragmented data and manual processes into APIs, services, internal platforms and automation. I work from process analysis and architecture through deployment, diagnostics and end-to-end user-flow validation. Experience delivering solutions for government organizations and private clients.

Portfolio: renosaza.github.io

CORE STACK

Python / Java / Rust / SQL

FastAPI / REST APIs / PostgreSQL / Redis

Linux / Docker / nginx / CI/CD

LLM APIs / RAG / Tool Calling / Embeddings

KEY EXPERTISE

BACKEND

API design, service architecture, databases, background jobs, authentication, file processing and integrations.

INFRASTRUCTURE

Linux deployment, Docker, nginx, logs, smoke checks, permissions, incident diagnostics and production support.

GEOSPATIAL

Map-centered interfaces, domain data, search, validation and spatial workflows used for analysis and coordination.

APPLIED AI

AI assistants connected to APIs, documents, forms, notifications, tool calling, RAG and workflow automation.

SELECTED EXPERIENCE

GEOSPATIAL OPERATIONS PLATFORM

Development of a domain-specific map platform joining structured records, spatial context, search, validation and backend workflows. The map functions as an operational layer for analysis and decision-making.

PRIVATE PROJECT

AI CHATBOTS & WORKFLOW ASSISTANTS

Integration of task-focused assistants with APIs, documents, forms, notifications, routing, context and business logic. Designed to reduce manual work rather than act as generic model wrappers.

CLIENT WORK

BACKEND SERVICES & INTERNAL TOOLS

APIs, service components, automation, administrative utilities and reporting flows using PostgreSQL, Redis, background jobs, file processing and Linux-based operation.

SYSTEMS

APPLIED ML & DATA PIPELINES

LLMs, embeddings, retrieval, classification, structured extraction, tabular processing, normalization and practical quality evaluation.

APPLIED R&D
