

Laposhin Vladislav

AI / LLM Engineer (Middle+)

Telegram: @rize02 | GitHub: github.com/renosaza | Portfolio: renosaza.github.io

3 years 2 months of cumulative project experience | Remote work | Full delivery cycle

Professional profile

AI-focused backend engineer with 3 years and 2 months of cumulative project experience. I design dialogue assistants and LLM systems, connecting models to APIs, documents, knowledge bases and internal services. I work across the full cycle: business-process analysis and hypothesis validation, architecture, production-ready Python backend, tools/function calling, RAG and context enrichment, structured output, quality testing, deployment, logging and production diagnostics.

Core competencies

- LLM and agents: prompt engineering, structured output, function/tool calling, agent chains, context and memory management, routing and fallback scenarios.
- RAG and data: embeddings, retrieval, data preparation and normalization, chunking/indexing architecture, knowledge-base quality evaluation and structured extraction.
- Backend: Python, FastAPI, REST APIs, PostgreSQL, Redis, background jobs, authentication, integrations, file and document processing.
- MCP and tools: design of tool layers, MCP integrations and contracts between agents, external services and user interfaces.
- Reliability: Linux, Docker, nginx, CI/CD, logging, smoke and UI testing, observability, incident diagnostics, safe deployment and rollback.
- Communication: architecture documentation, decomposition of unclear requirements, solution alignment with stakeholders and transfer of technical context to a team.

Project experience - 3 years 2 months

AI assistants and workflow automation

AI / Backend Engineer

- Designed dialogue assistants for web, Telegram and internal workflows with APIs, documents, forms, notifications and business logic.
- Implemented tool/function calling, request routing, context management, prompt templates and structured responses.
- Developed Python backend components and integrations with LLM APIs, databases and external services, including error handling and controlled fallbacks.
- Validated quality with test sets and end-to-end user scenarios, versioned changes, logged behavior and analyzed unstable responses.

Geospatial platform and batch geocoder

Backend / Data / AI Engineer

- Developed an operational web platform combining domain records, maps, search, validation and backend workflows for analysis and coordination.
- Built an XLSX/XLS/CSV processing pipeline with automatic address-column detection, normalization, batch processing, confidence scoring and manual-review flows.
- Worked with large exports, quality validation and safe deployment of an isolated service inside an existing production environment.
- Used Linux, Docker and nginx with logging, smoke and UI checks, diagnosing data and infrastructure issues without disrupting the main product.

Project experience - continued

Paragon - terminal AI kernel and agent architecture

Project Author / Rust Engineer

- Designed a modular terminal-first AI kernel architecture for cloud and local models, native coding agents and pluggable tools.
- Prepared a compiling Rust workspace scaffold with clear provider, agent, Git, storage, TUI and module boundaries.
- Defined tool permissions, session event logging, pause/resume/interrupt behavior, Git diff visibility and MCP/custom-profile/sandbox/approval layers.
- Documented architecture decisions, module contracts, risks and implementation order; the project is under active staged development.

Backend services and internal tools

Backend Engineer

- Built REST APIs, service components, PostgreSQL/Redis integrations, background jobs, file-processing flows, administrative utilities and reporting pipelines.
- Automated repetitive operations and connected fragmented tools into reproducible workflows with explicit logs and state.
- Supported the complete user path from requirements and data models to deployment, verification and failure recovery.

Technologies

- Core: Python, FastAPI, SQL, PostgreSQL, Redis, REST APIs, Linux, Docker, nginx, Git, CI/CD, Bash.
- AI / LLM: LLM APIs, prompt engineering, structured output, function/tool calling, RAG, embeddings, agents, memory/context, MCP, Ollama and local inference.
- Additional: Java, Rust, tabular and document processing, geospatial systems, data validation, observability and architecture documentation.

Education

Far Eastern Federal University (FEFU), Institute of Mathematics and Computer Technologies - currently studying toward a higher-education degree.

Additional information

- Open profile and projects: github.com/renosaza; technical portfolio: renosaza.github.io.
- I prefer tasks where an LLM is part of a measurable product: assistants, automation, knowledge retrieval, document processing and internal platforms.
- I work beyond prompts, treating data, backend, integrations, security, deployment and observability as one system boundary.
