

RENOSAZA

BACKEND ENGINEER / INFRASTRUCTURE / GEOSPATIAL / APPLIED AI

github.com/renosaza | t.me/rize02

Government organizations and private clients

PROFILE

Backend-oriented engineer building production systems around operational data, maps, automation and AI integrations. Turns incomplete requirements and fragmented workflows into APIs, services, internal tools and deployable products.

SELECTED EXPERIENCE

Geospatial platform: map-centered operational layer combining structured records, spatial context, search, validation and backend workflows.

AI assistants and chatbots: integrations with APIs, documents, forms, notifications, tool calling and internal business logic.

Automation and internal tooling: scripts, integrations, reporting flows and admin utilities replacing repetitive manual work with traceable processes.

CORE STACK

Backend: Python, Java, Rust, FastAPI, REST APIs, authentication, background jobs

Data: PostgreSQL, Redis, validation, tabular processing, geospatial workflows

Infrastructure: Linux, Docker, nginx, deployment, logs, smoke testing, CI/CD

AI and ML: LLM APIs, chatbots, tool calling, RAG, embeddings, classification

WORKING APPROACH

Understand the real process, define service and data boundaries, build close to production, and validate the complete user flow including failure modes and recoverability.
